

Moment at the face of the column (ANSI/AISC 358-10, 6.10)

Step 1. Determine the moment at the face of the column, M_f .

$$M_f = M_{pr} + V_u S_h \quad M_f : \underline{1771.00} \text{ kN}\cdot\text{m}$$

where:

M_{pr} : Probable maximum moment at plastic hinge.

$$M_{pr} : \underline{1483.35} \text{ kN}\cdot\text{m}$$

$$M_{pr} = C_{pr} R_y F_y Z_e$$

where:

C_{pr} : Factor to account for the peak connection strength, including strain hardening, local restraint, additional reinforcement, and other connection conditions.

$$C_{pr} : \underline{1.13}$$

$$C_{pr} = \frac{F_y + F_u}{2F_y} \leq 1.2$$

F_y : Specified minimum yield stress.

$$F_y : \underline{413.00} \text{ MPa}$$

F_u : Specified minimum tensile strength.

$$F_u : \underline{520.00} \text{ MPa}$$

R_y : Ratio of the expected yield stress to the specified minimum yield stress.

$$R_y : \underline{1.10}$$

Z_e : Effective plastic section modulus of the section (or connection) at the location of the plastic hinge.

$$Z_e : \underline{2890675} \text{ mm}^3$$

V_u : Shear force at end of beam.

$$V_u : \underline{897.77} \text{ kN}$$

$$V_u = \frac{2M_{pr}}{L_h} + V_{gravity}$$

where:

L_h : Distance between plastic hinge locations.

$$L_h : \underline{3735.2} \text{ mm}$$

$$= L - 2 \cdot S_h$$

$V_{gravity}$: Factored beam shear force due to gravity loads.

$$V_{gravity} : \underline{103.52} \text{ kN}$$

S_h : Distance from face of column to plastic hinge.

$$S_h : \underline{320.4} \text{ mm}$$

= $L_{st} + t_p$ for a stiffened connection (4ES, 8ES)

L_{st} : Length of end-plate the stiffener.

$$L_{st} : \underline{295} \text{ mm}$$

t_p : Thickness of end-plate.

$$t_p : \underline{25.4} \text{ mm}$$
